

Introduction to oVirt

James Rankin

What is oVirt?

Large scale, centralized management for server and desktop virtualization

Based on leading performance, scalability and security infrastructure technologies

Provide an open source alternative to vCenter/vSphere

Two key components

- Hypervisor -> oVirt Node
- Management Server -> oVirt Engine

Goals of the oVirt project

- Build a community around all levels of the virtualization stack – hypervisor, manager, GUI, API, etc.
- To deliver both a cohesive complete stack and discretely reusable components for open virtualization management
- Provide a release of the project on a well defined schedule
- Focus on management of the KVM hypervisor, with exceptional guest support beyond Linux
- Provide a venue for user and developer communication and coordination

Governance

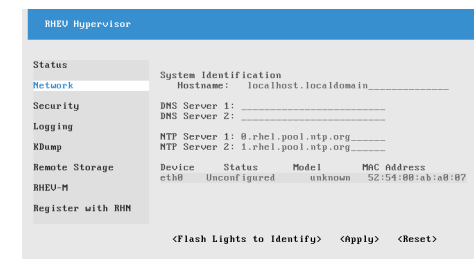

- Merit based, open governance model
- Built using the best concepts taken from Apache and Eclipse Foundations
- Governance split between board and projects
 - oVirt Board
 - Multiple projects under the oVirt brand

OPEN VIRTUALIZATION MANAGEMENT

- Standalone hypervisor
 - Small footprint ~ 170MB
 - Customized 'spin' of Fedora + KVM
 - 'Just enough' Fedora to run virtual machines
 - Runs on all RHEL hardware with Intel VT/AMD-V CPUs
 - Easy to install, configure and upgrade
 - PXE boot, USB boot, CD or Hard drive

oVirt Node vs. Full Host

oVirt Node

- Small footprint
- Pre-configured, no Linux skills needed.

Full Host

- Flexible
- Add monitoring agents, scripts etc. Leverage existing Fedora infrastructure.
- Hybrid mode capable

Management Features

Feature	Description
High Availability	Restart guest VMs from failed hosts automatically on other hosts
Live Migration	Move running VM between hosts with zero downtime
System Scheduler	Continuously load balance VMs based on resource usage/policies
Power Saver	Concentrate virtual machines on fewer servers during off-peak hours
Maintenance Manager	No downtime for virtual machines during planned maintenance windows. Hypervisor patching
Image Management	Template based provisioning, thin provisioning and snapshots
Monitoring & Reporting	For all objects in system – VM guests, hosts, networking, storage etc.
OVF Import/Export	Import and export VMs and templates using OVF files
V2V & P2V	Convert Physical servers or VMs from Vmware and Xen
VDI	Virtual Desktop Infrastructure for Windows and Linux
Power User Portal	Self Service Portal

How to Start?

- Build from source..
- Or, just install
 - yum install ovirt-engine
 - ./ovirt-setup
 - Add managed hosts
- Or, New: All-in-one live usb
http://wiki.ovirt.org/wiki/OVirt_Live

Verify connectivity between Host and Engine ?

 Save network configuration ?

OK
Cancel

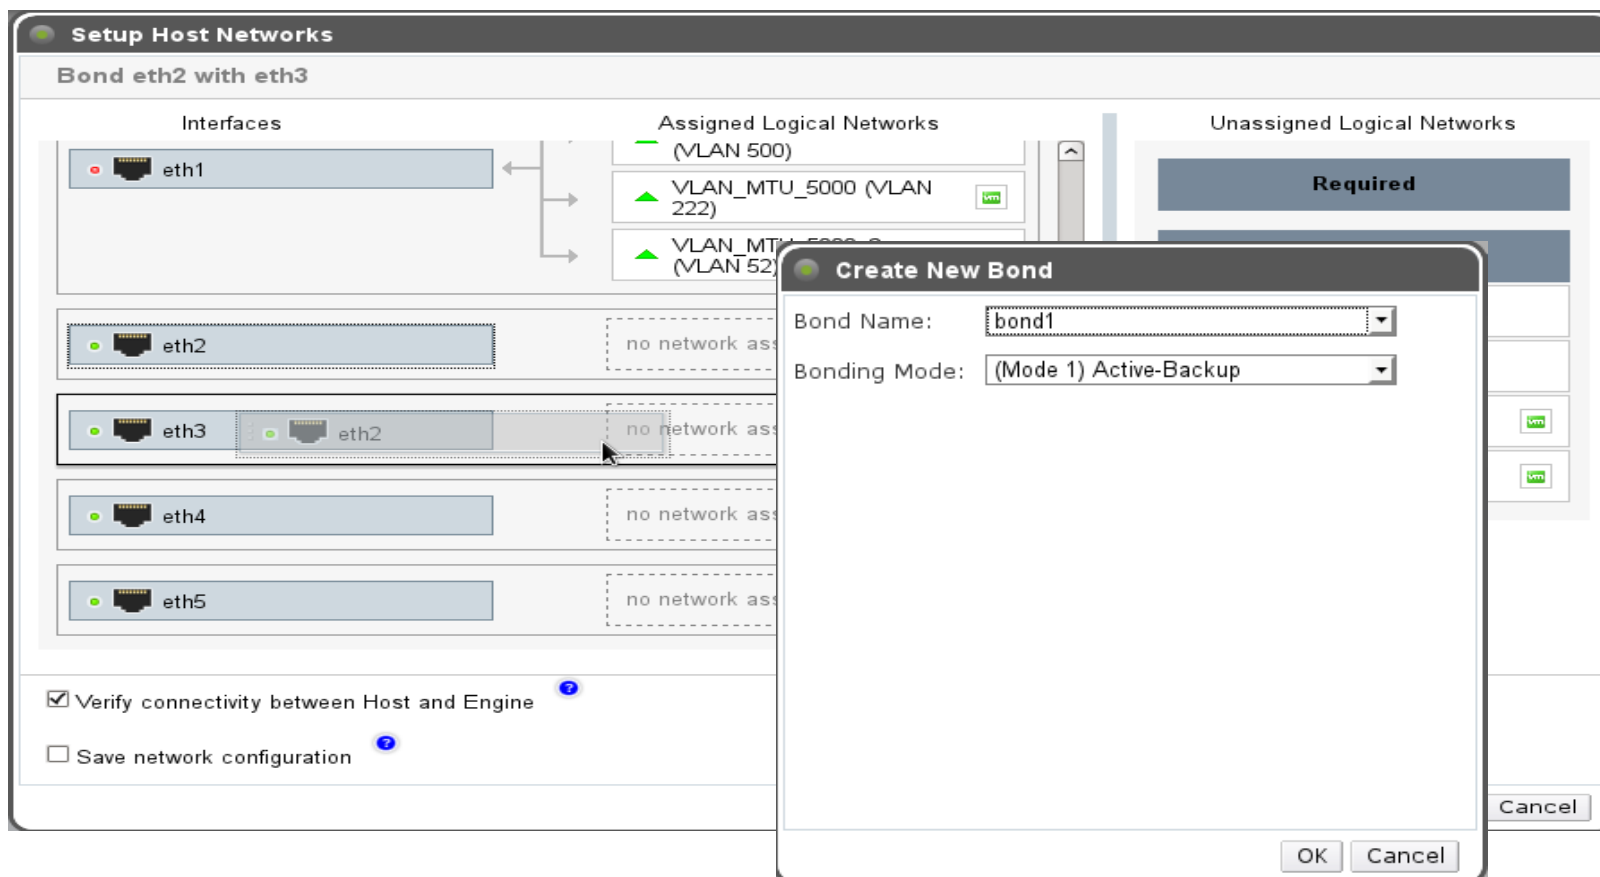

Setup Networks: Create Bond

- Drag an interface on top of another interface to bond the interfaces or to extend an existing bond

Setup Networks: Create Bond

- Drag an interface on top of another interface to bond the interfaces or to extend an existing bond

Setup Networks: Edit Bond

- Click the pencil icon to edit bond configuration

The screenshot displays the 'Setup Host Networks' window in oVirt. The main interface is divided into three sections: 'Interfaces', 'Assigned Logical Networks', and 'Unassigned Logical Networks'. In the 'Interfaces' section, a bond interface named 'bond0' is shown, which is composed of two slave interfaces, 'eth2' and 'eth3'. Below the bond interface, its configuration is displayed: 'Boot Protocol: None' and 'Bond Options: mode=1 miimon=100'. A pencil icon is visible next to the bond interface, indicating it can be edited. In the 'Assigned Logical Networks' section, a dashed box indicates 'no network assigned'. The 'Unassigned Logical Networks' section shows a list of available networks, including 'Required' and 'Non Required' categories, with specific network names like 'MTU_9000', 'VLAN_MTU_9000', 'MTU_9000 (VLAN)', 'MTU_9000_2', and 'MTU_9000_2'. A dialog box titled 'Edit Bond Interface bond0' is open in the foreground, showing the configuration for the bond interface. The dialog includes fields for 'Bond Name' (set to 'bond0'), 'Bonding Mode' (set to 'Custom:'), and 'Custom mode' (set to 'mode=1 miimon=100'). The dialog also has 'OK' and 'Cancel' buttons. At the bottom of the main window, there are two checkboxes: 'Verify connectivity between Host and Engine' (checked) and 'Save network configuration' (unchecked).

Setup Networks: Attach Network

- Drag a network from the unassigned networks list to the interface/bond to be attached

Configure Storage Once for Entire Cluster

```

USAGE

```
connect  
connect <url> <username> <password>
```

DESCRIPTION

Connect to a RHEV manager. This command has two forms. In the first form, no arguments are provided, and the connection details are read from their respective configuration variables (see 'show'). In the second form, the connection details are provided as arguments.

The arguments are:

- * url - The URL to connect to.
- * username - The user to connect as. Important: this needs to be in the user@domain format.
- * password - The password to use.

CLI - Smart Auto Completion

```
[oVirt shell (connected)]#
EOF          connect    create    disconnect  exit      list      shell     status
action      console  delete   echo        help     ping     show      update
[oVirt shell (connected)]#
[oVirt shell (connected)]#
[oVirt shell (connected)]# create

host vm
```

CLI - Smart Help

```
[oVirt shell (connected)]# help create host
```

```
create <type> [base identifiers] [attribute options]
```

DESCRIPTION

Create a new object with type host. See 'help create' for generic help on creating objects.

ATTRIBUTE OPTIONS

The following options are available for objects with type host:

- * --name: string
- * --address: string
- * --root_password: string
- * --cluster-id: string
- * [--port: int]
- * [--storage_manager-priority: int]
- * [--power_management-type: string]
- * [--power_management-enabled: boolean]
- * [--power_management-address: string]
- * [--power_management-user_name: string]
- * [--power_management-password: string]
- * [--power_management-options-option--LIST: {name=string,value=string}]

RETURN VALUES

- * 002 (COMMAND_ERROR)
- * 003 (INTERRUPTED)
- * 011 (NOT_FOUND)
- * 000 (OK)
- * 010 (REMOTE_ERROR)
- * 001 (SYNTAX_ERROR)
- * 004 (UNKNOWN_ERROR)

```
:█
```

```
[oVirt shell (connected)]# help create vm
```

```
create <type> [base identifiers] [attribute options]
```

DESCRIPTION

Create a new object with type vm. See 'help create' for generic help on creating objects.

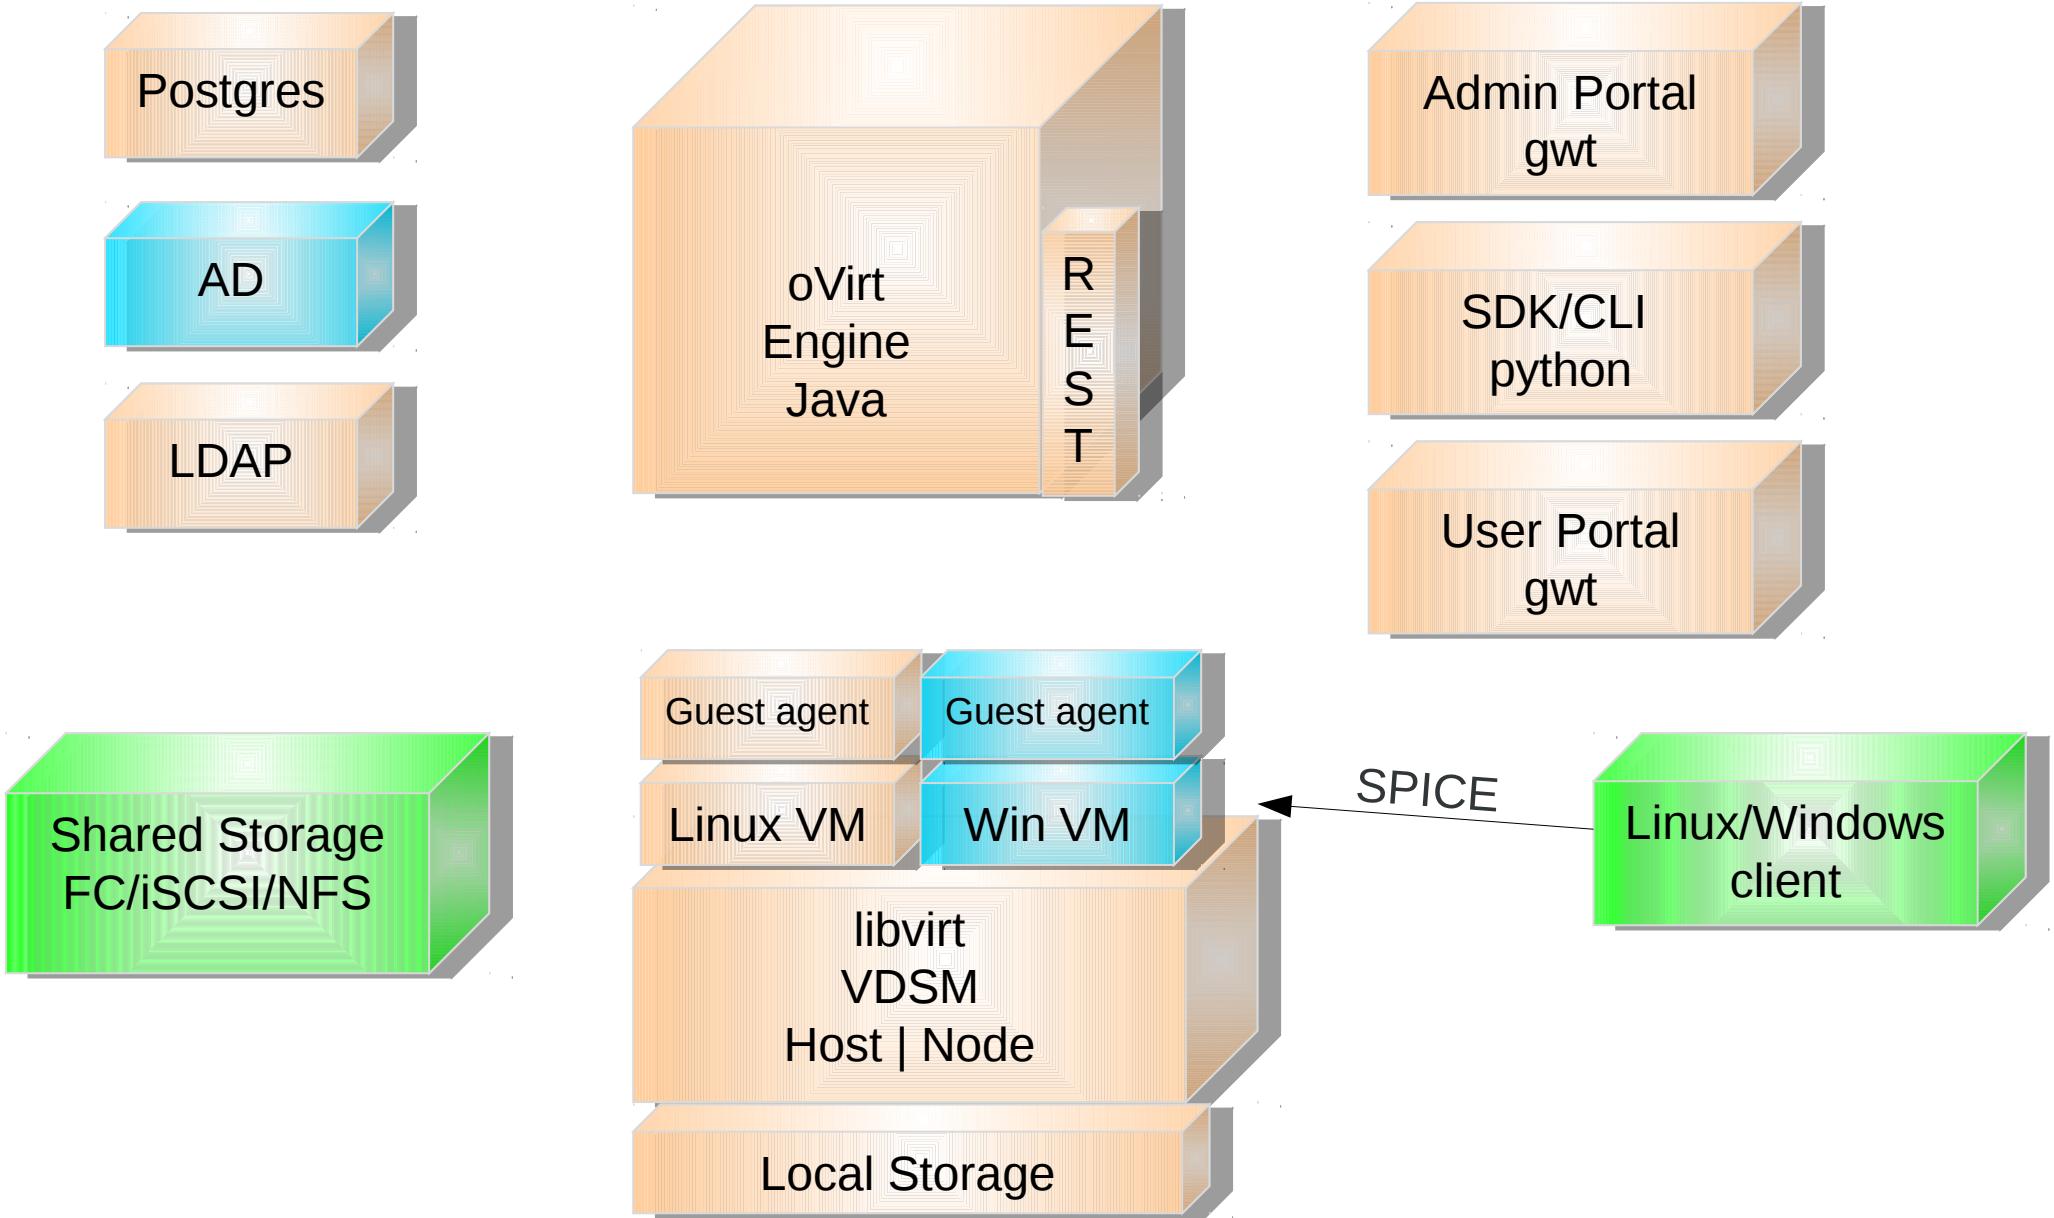

ATTRIBUTE OPTIONS

The following options are available for objects with type vm:

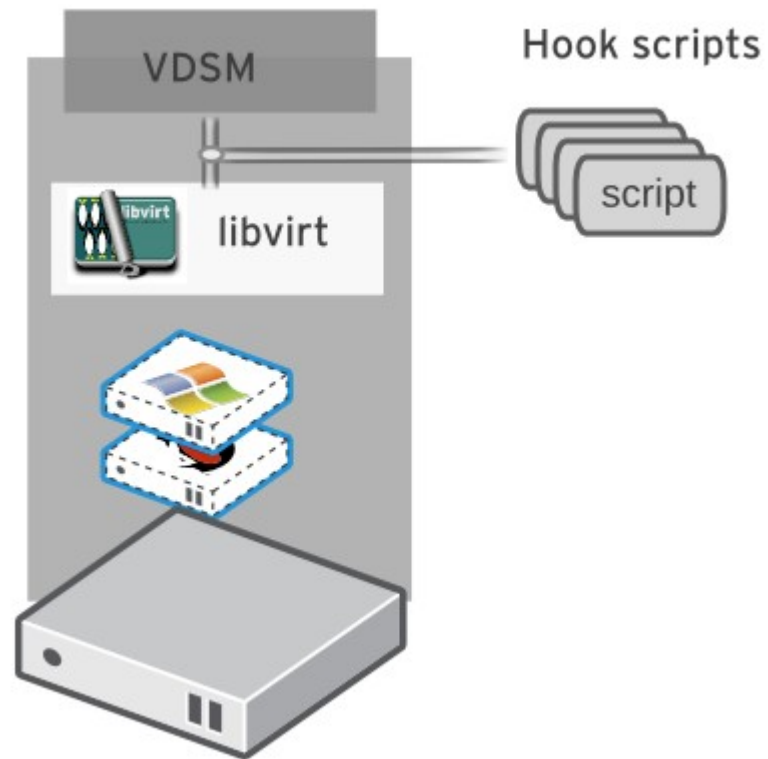

- * --name: string
- * --template-id{name: string}
- * --cluster-id{name: string}
- * [--timezone: string]
- * [--os-boot-dev: string]
- * [--custom_properties-custom_property--LIST: {name=string,value=string}]
- * [--os-type: string]
- * [--usb-enabled: boolean]
- * [--type: string]
- * [--os-initRd: string]
- * [--display-monitors: int]
- * [--display-type: string]
- * [--os-cmdline: string]
- * [--cpu-topology-cores: int]
- * [--memory: long]
- * [--high_availability-priority: int]
- * [--high_availability-enabled: boolean]
- * [--domain-name: string]
- * [--description: string]
- * [--stateless: boolean]
- * [--cpu-topology-sockets: int]
- * [--placement_policy-affinity: string]

```

```

oVirt High Level Architecture

- “Hook” mechanism for customization
 - Allows administrator to define scripts to modify VM operation
 - eg. Extend or modify VM configuration

- Hook scripts are called at specific VM lifecycle events
 - VDSM (management agent) Start
 - Before VM start
 - After VM start
 - Before VM migration in/out
 - After VM migration in/out
 - Before and After VM Pause
 - Before and After VM Continue
 - Before and After VM Hibernate
 - Before and After VM resume from hibernate
 - Before and After VM set ticket New in 3.1
 - On VM stop
 - On VDSM Stop
- Hooks can modify a virtual machines XML definition before VM start
- Hooks can run system commands – eg. Apply firewall rule to VM

Hooks

Name	Host
demo-vm	zeus02
demo-vm-2	
linux-vm	
nw-filter-vm-1	
nwfilter-vm-32-rhel-6: zeus02	
rhel63-vm	zeus02
vm-1-dc-30-cluster-3	
vm-del-net-2	
vm-del-net-bug	
vm-tempalte-test-1	
vm-tempalte-test-2	
vm-tempalte-test-3	
vm-tempalte-test-4	
win2008

General Network Interfaces

Name: nwfilter-vm-1

Description:

Template: Blank

Operating System: Red Hat Ent

Default Display Type: Spice

Priority: Low

Origin: oVirt

Run On: Any Host in Cluster

Custom Properties: Not-Configured

Cluster Compatibility Version: 3.2

Hooks

Hooks installed in /usr/libexec/vdsm/hooks

```
[root@host1 ~]# cd /usr/libexec/vdsm/hooks/
[root@host1 hooks]# ls -l
